**Abstract.** Two new  $\mu_3$ -oxo trinuclear heterometallic Fe<sub>2</sub><sup>III</sup>Cr<sup>III</sup> complexes with furan-2-carboxylic and salicylic acids with the composition: [Fe<sub>2</sub>CrO(C<sub>4</sub>H<sub>3</sub>OCOO)<sub>6</sub>(CH<sub>3</sub>OH)<sub>3</sub>]NO<sub>3</sub>·0.5CH<sub>3</sub>OH and [Fe<sub>2</sub>CrO(C<sub>6</sub>H<sub>4</sub>(OH)COO)<sub>7</sub>(CH<sub>3</sub>OH)<sub>2</sub>]·2DMA were synthesized starting from iron(III) and chromium(III) salts mixture. The complexes structures were confirmed by elemental analysis, IR, Mössbauer spectroscopies, and X-ray analysis. The atomic absorption spectroscopy confirmed that the iron: chromium ratio is 2:1. The thermal properties of both heteronuclear complexes have been investigated in oxidizing and inert atmospheres revealing the stability of the trinuclear core up to 170 and 220°C, respectively.

**Keywords:** heteronuclear  $\mu_3$ -oxo complex, Fe<sub>2</sub>Cr cluster, X-ray diffraction, thermal analysis.
